

# CBG Fairchild Challenge top 9 climate change cartoons

Doctor, I'm having trouble adapting to these stressful conditions. The world is too competitive, the climate is changing. I can't keep pace. My wife is cheating on me. The walls are closing in... Doctor...please... what do I do?  
Am I going crazy?

I recommend you take prescribed medication...

HA!!!  
TOLD YOU THAT  
GLOBAL WARMING  
WILL MELT THE  
GLACIERS AND  
CAUSE A  
FLOOD

The reason why I chose the glaciers is because the ice is melting from global warming and as you can see, Noah is laughing at the people for not believing that there was going to be a flood. So it all flooded and the people are staying on the roof of their houses.

"I feel extremely conflicted"

My cartoon is meant to play on the idea in case study 7.4, in which climate change may lead to a failure for farmers to produce coffee. However the cartoon is meant to show the irony that in America many of the farmers are contributing to global climate change as much as they are affected by it which proposes the issue, is using fossil fuels to cultivate and harvest crops worth the long term damage that is done to the environment and the agricultural industry.

According to the case study “Over 500,000 farm households in Uganda depend on coffee for their livelihoods”, not only do they depend on the money coming in but so does their communities to fund a currency based economy. So if climate change adversely affects the agriculture businesses then many 3<sup>rd</sup> world countries may sink deeper into poverty and take a step back from modern civilizations, or they may even starve due to famine.

Although the pain of climate change is felt world over America is and will remain one of the largest producers of food in the world. If we all don't stop causing global warming then the world as a whole will suffer.

My cartoon for climate change was inspired by case study 4.1. This case study explains that plant species are reacting differently to changing environmental conditions. Global climate change, caused by harmful carbon dioxide emissions, will spark the reassortment of species within plant communities.

My illustration depicts the devastating effects of human actions on our environment. The carbon footprint shown depicts man's burning of fossil fuels. This then leads to global climate change because the greenhouse effect traps in these emissions of carbon dioxide which increase the earth's temperature. Below the carbon footprint, the environment's native species are depicted by the sorry-looking wildflowers. Their fate is grim because they are being overtaken by invasive species.

The overall message of this cartoon is to promote biodiversity by decreasing the effects that we have on carbon dioxide emissions.
