

Family	Sapotaceae
Taxon	<i>Aubreginia taiensis</i>
Global distribution	(Aubrév. & Pellegr.) Heine
Published IUCN Red List Category	Côte d'Ivoire; Ghana
Date of assessment	2022
Ghana protected areas	Bia Tano FR, Mamang River FR, Southern Scarp (Akim) FR, Worobong South (Akim) FR, Nsuensa FR?
Ghana distribution	South central Ghana
Key threats	The habitat in both countries has substantially decreased in extent because of logging and agricultural encroachment. This species is also likely to be targeted for its timber as its tall and straight.
Ecology, distribution and population known	Ongoing survey work and population estimates known
Phenology understood	Research underway
Propagation protocol developed	Research underway
Ex situ collections established	A 1.5-hectare species conservation plot in the Montane forests of Mpraeso
Restoration stakeholders engaged and connected	Seed orchard established
Used within agroforestry	No
Protective measures in place <i>in situ</i>	All identified trees were tagged to prevent cases of future illegal logging
Local community engaged	Local community members have been engaged on the tree's identification and its conservation status
Sufficient capacity built to conserve the species	Training of 3 local forest guards & building capacity in identification of the species
Recognised and valued	Increasing due to public engagement
Key stakeholders for conserving the species	CSIR-Forestry Research Institute of Ghana
